

In main.js:

`this.form.firstname.length`: this will give the length of the string user inputs.

If: if this value is greater than 0, then, `ErrorFname` will remain **false**. Otherwise, it will be **true** and the error class will be applied to it.

The same logic has been applied to all other columns as well.

Problem:

When targeting elements, the initial string length value which is 0 is returned. So all them shows error, even if the columns are correctly filled and the email is been sent out.
